(54) STORAGE CONTROLLER

(57)Abstract:

PROBLEM TO BE SOLVED: To improve the access performance in sequential access, etc., by performing rearrangement to a physical storage device in units of logical storage drives and successively storing data on the physical storage device.

SOLUTION: A service engineer refers to access information 500 presented by an SVP 111 to examine the rearrangement of the logical disk drives 200. Consequently, when there is a logical disk 200 decided to be rearranged, a rearrangement indication 620 is sent to the storage controller 104. A director 106 receives the indication 620 and performs a logical disk rearranging process 630 between two specified logical disk drives 200. At this time, logical-physical correspondence information 300 is used to transfer data in one-process units to be rearranged from the physical disk drive 105 to a cache memory 107. Then the data 201 in the process units on the cache memory 107 are repeatedly written to the physical disk drive 105 as a rearrangement destination and the correspondence information 300 is updated after the writing is completed.

LEGAL STATUS

[Date of request for examination]

27.03.2003

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
